For our shareholders

7 Letter from the CEO
11 Our Executive Board
12 Report of the Supervisory Board
19 WACKER on the capital market
23 Highlights from 2024
26 We are WACKER

Dear Shareholders,

What makes a company successful?

Its employees! They make the difference, with their expertise, commitment and experience. More than 16,000 dedicated colleagues work for WACKER worldwide. They come from different cultures and operate in numerous markets and varied industries. They all share a desire to improve everyone's quality of life around the globe. By supplying innovative products and solutions. That is the purpose that drives us all at WACKER. It is how we add value for our customers and shareholders.

Our actions are based on our corporate values. We reaffirmed them in 2024: integrity and example – performance and passion – vision and openness – collaboration and appreciation. These values are firmly rooted in WACKER's DNA. They describe what WACKER stands for. This is not something recent, but has always been the case. They are our compass. They help us make the right decisions. In an increasingly complex, volatile and interconnected world, this guiding framework is more important than ever.

As we all know, a team's true strength shows itself in headwinds. Last year, these headwinds were still strong. Demand was weak in many customer sectors and competition was intense. There were no economic tailwinds. In this challenging market environment, the WACKER team performed well – although, as expected, we did not beat the previous year's sales and earnings figures. In 2024, we posted sales of €5.7 billion and EBITDA of €763 million.

Many companies curbed their production, especially in the construction and automotive sectors – key customer groups for our chemical products. So, it was particularly remarkable that our chemical divisions – Silicones and Polymers – maintained their overall sales level in 2024, with their total earnings even exceeding the previous year's figure. →

Dr. Christian Hartel
President & CEO of Wacker Chemie AG

More than

16,000

dedicated colleagues work for WACKER worldwide. They all share a desire to improve everyone's quality of life around the globe.

Our biotechnology division performed well last year, too. We increased not only its sales, but also its earnings year over year. In 2024, an important milestone for this division was the opening of our new mRNA competence center, which set the foundation for further growth.

At the Polysilicon division, business was a mixture of sunshine and rain last year. On the one hand, our hyperpure semiconductor-grade polysilicon, which is so important for us strategically, developed positively. On the other, our solar-grade polysilicon declined markedly. This was mainly caused by massive overcapacity in China and by lower prices. Germany's persistently high energy costs had a negative impact, too, as did a general market uncertainty, triggered by discussions about US anti-dumping tariffs on solar imports from some Southeast Asian countries.

To meet the challenges of continued market weakness, we intensified our focus on efficiency and cost discipline last year. Our measures are proving effective. As a result, we improved our earnings trend in 2024 through savings from ongoing efficiency programs. That was another strong team achievement. →

In 2024, our net income was €261 million. It is important for us that our shareholders participate in this result. The Executive and Supervisory Boards will therefore propose a dividend of €2.50 per share for 2024. This means we would be distributing around 50 percent of our net income for the year, which is further proof of WACKER's reliability!

Our strategy is intact. In the medium and long term, we will continue to benefit from global megatrends.

We are also progressing reliably on the sustainability front. And will not deviate from our path. Our targets are clear. They include a clear commitment to decarbonization: by 2030, we intend to halve our absolute CO_2 emissions relative to 2020. We have already saved about 30 percent of our CO_2 emissions. And we want to achieve net zero by 2045 at the latest. To this end, we have defined a clear reduction path, which is in line with the 1.5 °C target set by the Paris Agreement. In 2024, this path was validated by the independent Science Based Targets initiative (SBTi). This makes us one of the first chemical companies worldwide with a validated net zero target. We see this as an honor and an extra incentive.

Our aim, though, is not only to improve our own carbon footprint. For us, sustainability is also a business case. By offering our customers innovative, sustainable solutions, we aim to support them with their own sustainability targets. Take the following example: we will soon provide customers with a detailed carbon footprint for all our products. Completely automated! This shows that WACKER is part of the solution. We accept responsibility and will not accept the status quo.

Our investment spending reflects this. In 2024, we invested €666 million in total. By doing so, we are creating the basis for our future growth. For example, in 2024, we laid the cornerstone for a new site in Karlovy Vary in the Czech Republic. As early as this year, we will start producing silicone specialties there to meet key megatrends – from electromobility and healthcare to the energy transition. And at our largest site, Burghausen, we are expanding our capacities for hyperpure semiconductor-grade polysilicon. This material is chiefly needed for powerful chips that are used, for example, in the artificial intelligence sector.

Those were just a few examples. We invest in promising markets all over the world. Because our solutions are in demand everywhere. In 2024, we generated 84 percent of our sales outside of Germany. Clearly, we are well positioned to seize global growth opportunities. →

WACKER is well positioned for the future – financially, strategically and on the personnel front.

In the short term, though, general market conditions will remain challenging. At least, that is our assumption for now. So, we will intensify our focus on measures for profitable sales growth, cost discipline and cash flow. For 2025, we expect Group sales of between €6.1 billion and €6.4 billion. EBITDA is likely to come in between €700 million and €900 million.

Although current conditions are challenging, the good news is that our strategy is intact. For the medium and long term, we will continue to benefit from global megatrends. Sustainability, digitalization, health and smart construction are among the key drivers of our business. So, we will maintain our long-term growth targets. We still aim, by 2030, to achieve sales of €10 billion and an EBITDA margin above 20 percent. We reaffirmed this at our Capital Markets Day in 2024. We also clearly stated then that we will concentrate more on improving margins than on volume growth.

We want to create added value – for our customers and our shareholders.

Strategically, we aim to intensify our chemical divisions' focus on specialty business even more. For example, high-tech silicones for the energy and mobility transition, or polymers for smart, sustainable construction. At Biosolutions, the division's priorities are customized biotech products and next-generation medicines. At the Polysilicon division, we are increasingly focusing on the production of hyperpure semiconductor-grade polysilicon.

At the same time, we are steadily boosting our productivity and efficiency and cutting our costs. Key levers for this include an even more active approach to portfolio management and additional digitalization and automation measures. Financial soundness, after all, is essential for our success and, thus, for achieving our long-term targets.

You can be sure that we will use our potential. WACKER is well positioned for the future – financially, strategically and on the personnel front. Together, we will continue working on tomorrow's solutions. With expertise, customer proximity and innovative strength. It is what the WACKER team stands for around the world.

Our aim is for WACKER's share price to reflect our potential. This did not happen in 2024. Which was not satisfactory. Our mission is clear: we want to create added value – for our customers and for you, our shareholders. We adhere strongly to this principle. Because we are WACKER – reliable, resolute and ambitious.

Thank you very much for your trust.

Dr. Christian Hartel
President & CEO of Wacker Chemie AG

Dr. Peter-Alexander Wacker
Chair of the Supervisory Board of Wacker Chemie AG

Dear Shareholders,

2024, too, brought many challenges for the whole chemical sector. Markets were generally weak and the economy was impacted by numerous external factors. Despite these challenging conditions, Wacker Chemie AG remained on course, thanks to the commitment and dedication of more than 16,000 employees around the world.

In 2024, the Group again showed its capabilities as a world-leading specialty chemical company and a highly competent player in the biotechnology sector. Once more, the strengths of the Group's diversified business model were effective. The Group's broad focus on attractive growth fields and its global presence enabled business performance to remain within the projected corridor despite the challenging times. →

Business benefited, too, from the Group's strategy of continuously improving its processes and structures. For example, a continuous productivity program – the WACKER Operating System – was set up more than 20 years ago to cut operating costs each year. As in recent years, some 1,000 improvement measures were again implemented in the reporting year, resulting in savings of about €60 million. Continuous cost optimization is a key lever for enhancing the Group's competitiveness.

Last year saw key investments in the company's ability to innovate and in production-capacity expansions. The Group's innovative strength is reflected, for example, in some 3,100 active patents worldwide and in 1,100 patent applications currently pending globally. The strategic focus on specialty silicones gained momentum, with plant expansions at Zhangjiagang in China and construction work starting on a new production site at Karlovy Vary in the Czech Republic. Biotech business was strengthened as well, with a new competence center for mRNA actives opening in Halle (Saale), Germany. The Group's goal of increasing the percentage of semiconductor-grade polysilicon in its business portfolio came a big step closer with the expansion of capacity for hyperpure polysilicon at the Burghausen site. The new plant will start up in 2025.

Thanks to this strategic approach and the consistent focus on profitable growth and sustainability, Wacker Chemie AG remains well positioned for the future.

Continuous dialogue with the Executive Board

At WACKER, sound corporate governance and control are built on a relationship of trust between the Executive Board and Supervisory Board as they work closely together in the company's interest. In 2024, the Supervisory Board performed – with great diligence – the duties incumbent upon it under law, the Articles of Association and its own Rules of Procedure. The Supervisory Board was involved at an early stage in every decision of fundamental significance for the company.

In both written and oral reports, the Executive Board regularly provided the Supervisory Board with timely and comprehensive information on corporate planning, strategic development, business operations, and the current state of Wacker Chemie AG and the Group, including the risk situation, risk management, and compliance and sustainability issues. Beyond scheduled Supervisory Board meetings, the chair of the Supervisory Board remained in close contact with the Executive Board, especially with the CEO, conferring on issues of strategy, business development, risk exposure and of risk management, as well as on compliance, and was kept informed of current trends, the business situation, and key business transactions. Any deviations from business plans and targets were explained to the Supervisory Board in detail.

Wherever required by statutory provisions or the Articles of Association, the Supervisory Board voted on the reports and proposals of the Executive Board after detailed examination and discussion. There was no need for additional monitoring measures, such as the inspection of corporate documents or the appointment of experts. The Supervisory Board met on a regular basis, sometimes without the Executive Board being in attendance. →

In the reporting year, particularly close attention was paid to the current earnings situation, including the risk position and risk management, as well as to the company's liquidity and financial position.

The Supervisory Board held four meetings in 2024, two in the first half of the year and two in the second half. All Supervisory Board meetings were in person. Between meetings, the Executive Board informed the Supervisory Board in detail by means of written reports about all projects and plans of particular importance to the Group. At its full meetings and in its committees, the Supervisory Board discussed in detail business transactions of importance to the company and referred to the reports submitted by the Executive Board. The full meetings were prepared by shareholder and employee representatives in their own separate sessions.

The Supervisory Board's main areas of deliberation

The development of sales, earnings and employment at Wacker Chemie AG and the Group, together with strategic development opportunities, were the subject of regular consultations in the full meetings of the Supervisory Board.

In the reporting year, the major areas of deliberation for the Supervisory Board were:

- Global market challenges, particularly persistently high raw-material and energy costs
- Geopolitical developments and the resulting opportunities and risks for our business
- M&A and CapEx projects
- Financing activities

The Supervisory Board discussed the WACKER Group's plans for 2025 at its meeting of December 5, 2024. On that occasion, the Supervisory Board also dealt with medium-term corporate plans for 2025–2029. In addition, it discussed and approved the capital-expenditure budget for 2025.

Work in the committees

The Supervisory Board is assisted in its work by the committees it has constituted. WACKER's Supervisory Board has created three committees – an Audit Committee, an Executive Committee, and a Mediation Committee (the latter in accordance with Section 27 (3) of the German Co-Determination Act (MitbestG)). The tasks and the members of these committees are detailed in the declaration on corporate management on page 331 et seq.

The Audit Committee met four times in person last year. In the presence of the auditors, it discussed the audit of the annual financial statements of Wacker Chemie AG and the Group for 2023 and the consolidated interim financial statements for the first half-year. It also examined the Group's quarterly financial figures as well as issues relating to risk management, the accounting process, the internal control systems, compliance, auditing, and the preparatory review of sustainability reporting. It monitored the audit, especially regarding quality, as well as the independence of the auditors and the additional services they performed. The Audit Committee also submitted a recommendation to the Supervisory Board for the →

latter's proposal to the 2024 Annual Shareholders' Meeting about appointing an auditor for any reviews of interim financial reports for 2025 in the period preceding the ordinary Annual Shareholders' Meeting for the 2025 financial year. The Audit Committee then awarded the auditing contract for 2024 as per the resolution of the ordinary Annual Shareholders' Meeting for the 2023 financial year and determined the focus of auditing.

The Executive Committee met once in person in 2024. The committee members discussed recommendations to the Supervisory Board for determining the Executive Board's total compensation in 2023 and its performance goals for variable compensation in 2024.

The Mediation Committee did not need to be convened in the reporting year.

The Supervisory Board was regularly informed about the committees' work.

Initial and advanced training

The members of the Supervisory Board are called upon to take part in training courses at regular intervals and are responsible for meeting this obligation themselves. The company supports the members in their educational endeavors, in particular by granting them generous expense allowances, which can and should be used for further training, among other things. When they take office, new Supervisory Board members receive an information package about their rights and obligations; it also includes information sheets on insider-trading bans and on personal transactions by managers. Where necessary, they are also informed about significant changes in legislation and court rulings affecting their work, or are able to take part in internal information events.

Personalized disclosure of attendance at meetings

Last year, four members were excused from one Supervisory Board meeting each and one member was excused from two meetings. Otherwise, all members of the Supervisory Board attended all of its meetings. As regards the committees' meetings, one member was excused from one meeting in 2024. Otherwise, all committee members attended their respective committee meetings. Members' attendance at meetings of the Supervisory Board and at their respective committee meetings is disclosed in personalized form in the following table: →

Corporate governance

Last year, the Supervisory Board looked closely at corporate governance standards. At its meeting of December 5, 2024, the Supervisory Board, as scheduled, dealt with application of the German Corporate Governance Code and adopted the annual declaration of conformity that must be submitted jointly by the Executive and Supervisory Boards in accordance with Section 161 of the German Stock Corporation Act (AktG). This declaration is available on the company's website and is also included in the declaration on corporate management on page 331 et seq.

Further information on corporate governance at WACKER can likewise be found in the declaration on corporate management on page 331 et seq. →

At its December meeting, the Supervisory Board also conducted a self-assessment and found that it works efficiently – for example, due to the regular preliminary discussions regarding the Supervisory Board meetings, the comprehensive reports provided by the Executive Board and the detailed documents received well in advance of the meetings. Further information on the Supervisory Board's regular self-assessments can be found in the declaration on corporate management on page 331 et seq.

Audit of the annual financial statements of Wacker Chemie AG and the WACKER Group

PricewaterhouseCoopers GmbH Wirtschaftsprüfungsgesellschaft, Munich, audited the annual financial statements of Wacker Chemie AG, the consolidated financial statements and the combined management report – including the Group Sustainability Report – for 2024. PricewaterhouseCoopers GmbH Wirtschaftsprüfungsgesellschaft has audited Wacker Chemie AG and the WACKER Group since 2024. The persons responsible for signing the audit are Dietmar Eglauer and Anita Botzenhardt.

The Supervisory Board's Audit Committee had awarded the auditing contract in accordance with the resolution of the Annual Shareholders' Meeting of May 17, 2023. The auditors conducted their audit in accordance with Section 317 of the German Commercial Code (HGB) and the EU Audit Regulation, and in compliance with German Generally Accepted Standards for Financial Statement Audits promulgated by the Institut der Wirtschaftsprüfer (IDW). They issued unqualified audit opinions.

The auditors also carried out a review with limited assurance of the Group Sustainability Report. Accordingly, no issues were identified that would indicate that the statement did not satisfy the statutory requirements in all material respects.

The financial-statement documents (including the auditors' reports, the combined management report – with the Group Sustainability Report – and the Executive Board's proposal for the distribution of profits) were submitted to all the Supervisory Board members in good time.

At its meeting of February 18, 2025, the Audit Committee examined and discussed in detail the combined management report for Wacker Chemie AG and the Group, including the Group Sustainability Report, as well as the auditors' reports. The full Supervisory Board, at its meeting of February 27, 2025, closely examined and discussed the relevant annual accounting documents – including the Group Sustainability Report – with knowledge and in consideration of both the report of the Audit Committee and the auditors' reports. The auditors, Dietmar Eglauer and Anita Botzenhardt, took part in the deliberations at both meetings. In addition, Hendrik Fink attended these meetings as the auditor responsible for the Group sustainability report. The auditors reported on the main results of the audits – in particular, the key audit matters described in the auditors' reports and the outcome of the review of the Group Sustainability Report – and were available to answer questions and provide supplementary information. →

After concluding its own examination, the Supervisory Board has no objections to raise to the annual financial statements of Wacker Chemie AG, the consolidated financial statements, the combined management report for Wacker Chemie AG and the Group – including the Group Sustainability Report – or the auditors' reports.

The Supervisory Board therefore approves the annual financial statements of Wacker Chemie AG and the consolidated financial statements as of December 31, 2024 as prepared by the Executive Board. The annual financial statements of Wacker Chemie AG are hereby adopted. The Supervisory Board concurs with the Executive Board's proposal for the distribution of retained profit. In accordance with Section 162 (3) sentence 2 of the German Stock Corporation Act, the compensation report for 2024 was examined by the auditors to determine whether the disclosures required by law pursuant to Section 162 (1) and (2) of the German Stock Corporation Act were made.

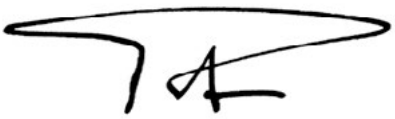

Changes in the composition of the Supervisory and Executive Boards

On the Supervisory Board, Markus Hautmann stepped down at the end of August 31, 2024. Günter Zellner succeeded him as employee representative on the Supervisory Board. He was appointed at the Executive Board's request by order of the District Court of Munich – Registry Court – effective October 7, 2024.

There were no changes to the composition of Wacker Chemie AG's Executive Board in 2024.

The Supervisory Board would like to sincerely thank every employee in WACKER's global network, the Executive Board's members and the employee councils for their commitment and dedication, and their contributions to the Group's success. On this basis, WACKER will, moreover, master the challenges ahead and successfully maintain its market position with its innovative solutions.

Munich, February 27, 2025
The Supervisory Board

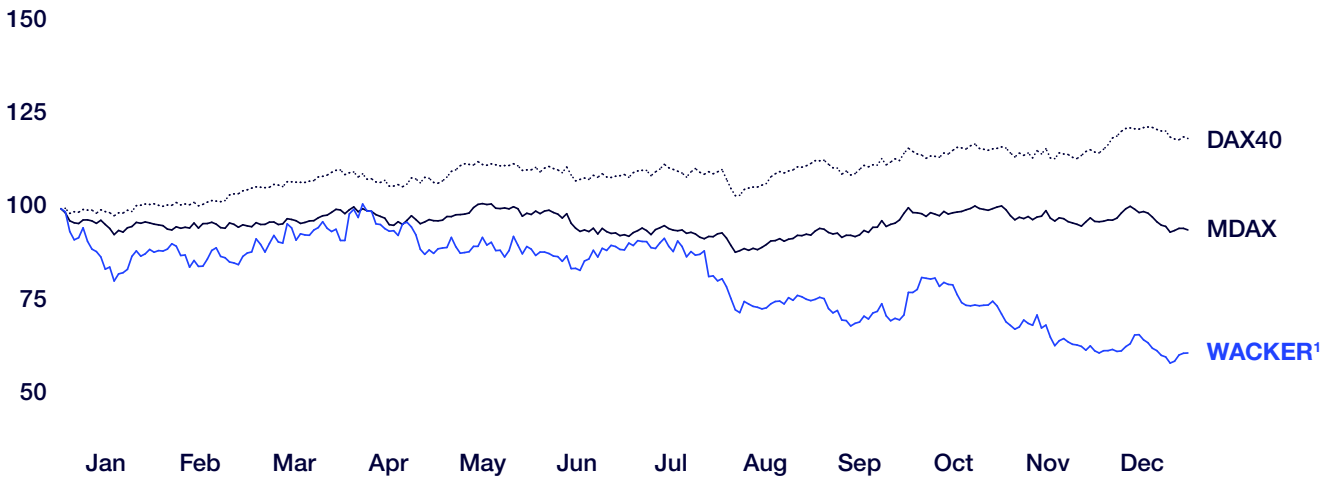

Dr. Peter-Alexander Wacker
Chair of the Supervisory Board of Wacker Chemie AG

WACKER on the capital market in 2024

Stock market developments in 2024 were impacted by sustained geopolitical tensions between the USA and China, and by the wars in Ukraine and the Middle East. Despite many negative factors, global equity markets generally performed well. All of the major stock market indices reported gains.

Germany's leading index, the DAX, gained ground in 2024, climbing some 19 percent compared with year-end 2023. German small caps largely missed out on the positive trend on the global stock markets. The MDAX, for example, lost almost 6 percent in the reporting period from January through December.

WACKER share performance in 2024 (indexed to 100)[1]

[1]100 = €114.3 (year-end closing price on Dec. 29, 2023)

Source: Xetra closing prices

At the start of 2024, WACKER stock stood at €114.30 (year-end closing price on December 29, 2023). After reaching a year-high of €116.70 on April 8, 2024, WACKER stock then declined during the rest of the year. WACKER stock ended trading on December 30, 2024 at €70.04, down 39 percent on the start of the reporting period and corresponding to a market capitalization of around €3.48 billion.

WACKER's share price reflected the persistently difficult market conditions. The German economy stalled. Many companies with direct sales to end consumers curbed their production in 2024, with the automotive and construction industries, in particular, putting in a weak performance. At our Polysilicon division, lower demand for solar-grade polysilicon impacted business. Ongoing US antidumping investigations into solar-product imports from some Southeast Asian countries continued to unsettle markets. →

Dividend proposal of €2.50 per share

WACKER's dividend policy is to distribute about 50 percent of net income for the year to shareholders. The Executive and Supervisory Boards will therefore propose a dividend of €2.50 per share at the Annual Shareholders' Meeting. Based on the number of shares entitled to dividends as per December 31, 2024, the cash dividend corresponds to a payout of €124.2 million.

Dividend trends

€	2024[1]	2023	2022
Dividend	2.50	3.00	12.00
Dividend yield[2] (%)	2.6	2.3	8.6

WACKER communicates closely with capital markets

Key elements of corporate strategy are sustainability and a focus on specialty chemicals. These priorities are reinforced through continuous and open communication with institutional investors, private investors and analysts.

At our Capital Markets Day on September 19, 2024, we confirmed our strategic growth and sustainability targets communicated in 2022. WACKER is aiming, by 2030, to generate sales of €10 billion and an EBITDA margin in excess of 20 percent. Also by 2030, absolute CO_2 emissions will be reduced by more than 50 percent as against the 2020 baseline. We will be focused more on improving our margins than on volume growth. This means intensifying investments in efficiency measures and in expanding our portfolio of specialty products.

In 2024, the number of analysts covering WACKER remained unchanged at 18. The consensus price target of analysts for WACKER stock declined during the year. At the beginning of the year, the average price target for WACKER stock was €145.56 (18 estimates, December 2023). At year-end, the average price was €113.72 (18 estimates), about 22 percent lower than at the beginning of the year.

Highlights from 2024

01 Net Zero by 2045 target validated

January The independent Science Based Targets initiative (SBTi) has validated that WACKER's greenhouse gas reduction path is in line with the 1.5 °C target set out in the Paris Agreement. This makes WACKER one of the first chemical companies worldwide with a validated net zero target.

02 Celebrating 40 years in Southeast Asia

May Diverse cultures, attractive markets, fast-growing economies – that's what Southeast Asia stands for. No wonder, therefore, that WACKER has been present in the region for four decades. Today, the company is represented in Singapore, Indonesia, Thailand, the Philippines, Malaysia and Vietnam. The WACKER ACADEMY Singapore supports our customers, partners and employees by creating a culture of sharing knowledge and experience relating to silicone and polymer chemistry.

03 Acquisition in the United States

May By acquiring Bio Med Sciences' equipment and know-how in the United States, WACKER is expanding its expertise in the fully integrated development and production of silicone-coated pressure-sensitive adhesive products. Thanks to their unique skin compatibility and easily customizable adhesive properties, silicones offer outstanding product solutions for medical and cosmetic applications.

04 WACKER House opens its doors

June WACKER opened its new company headquarters, WACKER House, in Munich's Werksviertel district. Being more than just a new building, this also marks a new working environment: more modern, more flexible and more agile. It is therefore a key catalyst for creative ideas, inspiration and innovation, and, ultimately, entrepreneurial success. The state-of-the-art building is designed to meet the latest standards in sustainable building technology. With its innovative approach to office life, WACKER House offers an attractive working environment for around 600 employees on five floors.

05 Groundbreaking ceremony in the Czech Republic

June With the construction of a new plant in Karlovy Vary, Czech Republic, WACKER is strengthening its strategic focus on the production of silicone specialties for key megatrends such as the energy transition, electromobility and healthcare. The investment volume in this project is in the triple-digit million euro range. Operations are scheduled to commence in late 2025 and around 200 new jobs are expected to be created there by 2028.

06 WACKER opens mRNA Competence Center in Halle, Germany

June WACKER has set another milestone by opening an mRNA competence center at its biotech site in Halle (Saale). The new facility enables the large-scale production of active ingredients based on messenger ribonucleic acid (mRNA), such as anti-Covid mRNA vaccines. Part of the new capacity is being made available to the German government as part of its pandemic-preparedness plan in order to swiftly respond and supply Germany with vaccines as and when required.

07 Success Made by Diversity

August There is a good reason why we say “Made in Germany” and not “Made by Germans.” Because employees from all over the world – regardless of where they come from – give their best at WACKER. This is why we support the “Made in Germany – Made by Vielfalt (Diversity)” initiative. Under this motto, more than 40 German family-owned businesses are speaking out in favor of more tolerance and openness in society.

08 Strengthening our specialties portfolio for our semiconductor customers

September WACKER has developed a new silane for the manufacture of highly integrated memory chips and microprocessors, vital components that, among other things, are crucial in artificial intelligence and cloud computing. The starting product reacts with the wafer surface to form an ultrathin insulation layer that ensures the reliable and trouble-free function of highly integrated microchips.

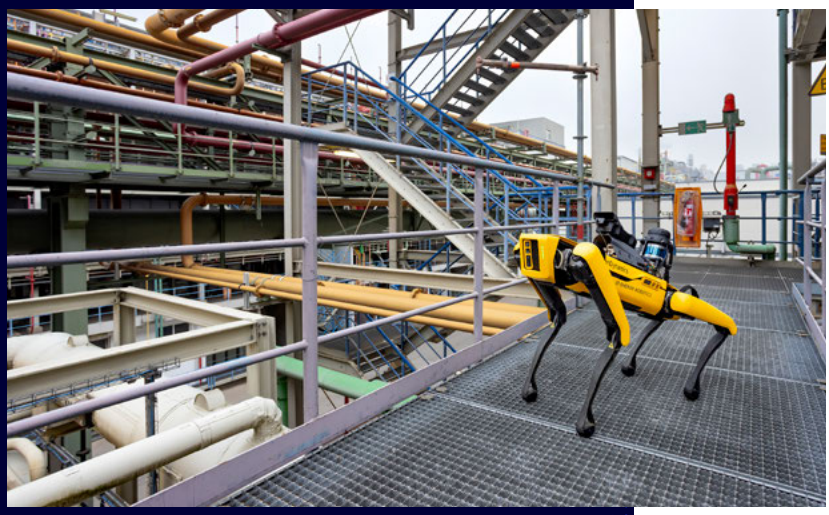

09 Capital Markets Day: WACKER strategy confirmed

September WACKER reaffirmed its strategic growth and sustainability targets presented in 2022: by 2030, WACKER aims to achieve sales in the region of €10 billion and an EBITDA margin of over 20 percent. Also by 2030, absolute CO_2 emissions will be reduced by more than 50 percent as against the 2020 baseline.

10 Silicon production: Successful carbon capture

September Silicon is WACKER's most important raw material. Over 60 percent of our products are based on silicon. Silicon is produced from quartz and carbon. WACKER has its own production site in Holla, Norway, where carbon dioxide generated from silicon production was successfully captured in a pilot project. The capture process allows us to utilize or store the carbon dioxide generated during silicon production.

11 Robotic dog on its inspection rounds

November WACKER employs not only teams of experts, but high-tech colleagues too – robots that carry out a wide range of tasks. One of our latest AI-aided ventures is a robotic dog that supports production teams in inspecting plants. The German Chemical Industry Association (VCI) presented the robotic dog with its Responsible Care® Award in the "Best Digitalization Project" category.

12 Celebrating 25 years of WACKER Middle East

December WACKER Middle East was founded 25 years ago in Dubai with the aim of delivering tailored solutions to meet the challenges in the Middle East and Africa. Ever since, the site has been constantly expanding and it doesn't stop there: in 2024, WACKER Middle East was given the go-ahead for constructing a 1,000-square-meter extension, which will add to the current floor space and serve as an application technology center.

We make a difference.

Collaboration and appreciation
Together we are stronger. This principle extends beyond our internal operations at WACKER. We also collaborate closely with external partners. Take, for example, CordenPharma.

Production takes place behind glass in cleanroom conditions at the mRNA Competence Center in Halle.

“Together, we have achieved pandemic readiness in Germany in record time.”

Germany is ready. In the event of another pandemic, vaccine production is guaranteed – thanks to the collaboration between CordenPharma and WACKER. The German government signed preparedness agreements with the two companies in 2022, showing that lessons had been learned from the COVID-19 pandemic.

Once the contracts had been awarded, the two companies embarked on a mammoth project with an ambitious deadline: they had just two years to achieve “pandemic readiness” and an annual production capacity of 80 million mRNA (messenger ribonucleic acid) vaccine doses. Should the need arise, the Center for Pandemic Vaccines and Therapeutics (ZEPAI) acting for the Federal Ministry of Health will contact the developer of the specific vaccine required. WACKER and CordenPharma will then jointly produce it. That is the plan. →

“We want to continue to grow at WACKER. Our biotechnology business plays a crucial role here.”

Mathias Wiedemann, president of WACKER’s Biosolutions division.

Working in tandem to cover the entire process chain

“It was a challenge that none of us had ever faced before,” recalls Andreas Anton, who heads the Pandemic Preparedness project at WACKER. “But we have a great team and we collaborated very well with each other. Everything aligned perfectly – in terms of our companies’ capabilities and also on a personal level.” Between them, WACKER and CordenPharma cover the entire process chain for mRNA vaccine production – from the manufacture of plasmid DNA starter material to the filling of the finished mRNA active. Alexander Radspieler, Anton’s counterpart at CordenPharma, explains the “rules of the game” of pandemic readiness:

“First, secure a supply of vaccines by ensuring all essential steps take place in Germany. Second, secure independence from external supply chains by ensuring the entire process occurs within the European Union.”

Against this background, WACKER chose to carry out production at its biotech site in Halle, Germany. There, it erected a new mRNA Competence Center, comprising four biopharmaceutical production lines. Groundbreaking took place on July 5, 2022. Less than two years later, the building was complete. This set a new world record for the fastest construction of a production facility for pharmaceutical actives. Meanwhile, CordenPharma decided that its production sites in Frankfurt am Main (Germany), Chenôve (France) and Caponago (Italy) would be brought into a state of pandemic readiness. It substantially expanded its lipid production capacity and simultaneously invested in supercritical liquid chromatography, an eco-friendly method of lipid purification. It also expanded its aseptic fill & finish capacity.

Successfully stocking up on staff

To ensure the project’s success, the WACKER team in Halle drew up comprehensive plans and schedules. After all, it was necessary to design and erect a new building, obtain the requisite equipment and hire and train considerably more staff. Anton recalls: “We went to great lengths to recruit talented individuals. For example, we ran a digital campaign using influencer videos to attract young people. That worked well.” In just one year, WACKER recruited more than 100 staff in Halle. They were trained straight away, even though the high-tech building was not yet finished. Special rooms were fitted out so that they could practise operating the machines. Where these were not yet available on site, they practised on virtual reality modules.

Protection for the active ingredient

Halle plays a key role in pandemic preparedness, because it is where all the central process steps take place. Says Anton, “The first thing we do there is produce the plasmid DNA, the starter material for manufacturing the mRNA vaccine.” Radspieler continues, “After that, we add our lipids to create the vaccine formulation. This crucial process step combines the mRNA with lipids to form liquid nanoparticles (LNPs). These are then packed inside a molecular envelope that protects the sensitive vaccine →

Lipids for formulating mRNA active ingredients are stored in large steel tanks.

when it is being delivered to the muscle cells at the injection site. Before vaccination can happen, though, the vaccine is deep-frozen and sent to our aseptic fill & finish facility in Caponago in northern Italy, where it is packaged in pre-filled syringes and vials."

The experience gained by WACKER and CordenPharma from working on their own projects during the early days of mRNA vaccine development is standing them in good stead. During the COVID-19 pandemic, CordenPharma produced the lipids for the Moderna vaccine. WACKER successfully produced a candidate compound. The process technology needed for industrial-scale mRNA vaccine production was scaled up at WACKER's Amsterdam site and laid the groundwork for setting up the mRNA competence center in Halle, where it ultimately invested over €100 million.

Flexible production lines

"As we don't know which customer will be approaching us with a vaccine on Day X, we need to be prepared for everything," explains Anton. "We designed the new facility around a modern process model that offers maximum flexibility." As a result of this "ballroom concept", there are no fixed pipe systems in the production rooms in Halle. Everything is designed to be as versatile and modular as possible, and the equipment is easy to move around. A "warm base" principle has also been adopted, whereby production equipment and staff are always on standby. The necessary raw materials and auxiliaries have also been stockpiled and are managed via a special storage and monitoring system. A logistics system connects all participating sites.

"For the next five years, we are in a state of pandemic readiness. If the German government gives the order to manufacture mRNA vaccines, we can start the production process shortly after," explains the WACKER expert.

This readiness also benefits our customers. In pandemic-free times, WACKER uses the facilities for pharmaceutical customers to produce active ingredients for clinical development. "But we can, and we do, make much more than mRNA vaccines – such as protein therapeutics, vaccines and plasmids," Anton points out. "We operate globally across our four biotech sites in San Diego, Amsterdam, Jena and Halle to ensure we always offer the best production conditions for a given product." Rapid switching between customer projects is a routine matter for WACKER and CordenPharma. As both are contract development manufacturing organizations or CDMOs, they are used to rapidly switching to other production processes. WACKER uses at least 50 percent of its capacity in Halle for customer projects, while the other half is reserved for vaccines production.

A top team with a sound plan

Overall, the pandemic readiness project involved several hundred staff members from WACKER and CordenPharma who spent many thousands of hours working on it. Without strong teamwork and mutual appreciation between WACKER and CordenPharma, this Herculean task would never have succeeded. Radspieler returns to this topic. "As we worked on the project, our trust in each other grew and that is what led to our joint success. We are now the only CDMO that can provide this service from start →

Aseptic filling line at CordenPharma in Caponago (Italy)

to finish. We have seen that we are a good match for each other and we can also win new projects in the future." As the experts from WACKER and CordenPharma never tire of saying: Pandemic readiness depends on sound plans – and on staying in close contact with all partners. After all, you want to play safe in the event of a new pandemic.

In Halle, Anton and his team have everything under control: time management, coordination of and collaboration with partners, service providers and ZEPAI. On March 27, 2024, he notified the authorities of pandemic readiness. Following intensive audits, the official confirmation came on June 1 that WACKER and CordenPharma are pandemic-ready. "That was the cherry on the top of the cake," says Anton, "because our mRNA Competence Center officially opened just two days later. It's amazing what you can achieve as a team." •

Andreas Anton (left), Senior Project Leader for Pandemic Preparedness at WACKER Biotech and Alexander Radspieler, Global Project Manager at CordenPharma

We empower creative minds.

Vision and openness
Questioning the way things are, being open to new ideas and always looking beyond the horizon – these are the hallmarks of WACKER employees all over the world. And Martina Schulze-Adams is no exception.

Martina Schulze-Adams is the senior vice president of WACKER's Corporate R&D and head of the Consortium, the company's central research facility in Munich. Guided by her vision and pioneering spirit, she works with her team to drive innovation, securing WACKER's position at the forefront of technological progress.

Ms. Schulze-Adams, WACKER is one of the most research-oriented chemical companies in the world. What issues are you currently pursuing in Corporate R&D?

Sustainability is a major driving force right now. Most of our research projects revolve around sustainability. We're also investing quite a lot in biotechnology, with over half of our lab space at the Consortium dedicated to biotech. And it doesn't stop there: we're also opening a new biotech center here on site in 2025. Those investments – which run in the double-digit-million-euro range – will help us continue strengthening Group research here at WACKER.

But there's one thing I'd especially like to emphasize: research should never be an end in itself – it should always move WACKER forward as a company. That was one of the founding principles of the Consortium, and it remains our standard to this day. Innovation is how we hope to make the world a little bit better. It's our purpose. That means consistently gearing our efforts to the needs of the market and of our customers, while also making sure we maintain a clear focus on the business and our finances. →

180

million euros is the amount that WACKER invests in research and development every year.

Manager and researcher: Martina Schulze-Adams became the senior vice president of WACKER's Corporate R&D in May 2024. She and her team are working hard to secure the future of WACKER's business.

How much in total does WACKER invest in research and development?

Over 180 million euros per year. WACKER currently has about 350 ongoing research projects throughout the world, which ensures our business remains on a solid long-term footing. We support all of our business divisions. In our Polymers division, for example, we're primarily concerned with maintaining steady progress in product development and expanding into new applications. If we didn't, we would be just another chemical company. The main focus in Polysilicon is on process improvements and on the question of how to continue increasing the purity of our products. We have to make sure that we're always taking the lead in that respect, especially when it comes to our semiconductor materials. But that's basically true for everything we do: we conduct research in order to maintain a technological edge on the market.

Easier said than done. How do you generate new ideas?

There's no patented formula for that. It ultimately comes down to interactions between a number of factors. We take a systematic look at major trends like sustainability or artificial intelligence, of course, which also includes having a regular presence at research conferences and congresses. Another traditional – and equally important – strategy is staying abreast of scientific publications: I often hear people say things like, "You know, I was just reading something that I think could really move us forward. And some ideas just arise by accident, at lunch or in a meeting. Somebody might learn that there's a chemical that biologists use for oxidation, and suggests that they do it electrochemically instead; not only would that make the process cleaner, but, if they used green electricity, it would be more sustainable too. That example highlights the huge benefit of the Consortium: it brings people together from completely different disciplines, from molecular biology to organic chemistry to electrochemistry. And that enriches everyone.

Overview of the WACKER Consortium

- Central research facility at WACKER
- Established in Nuremberg in 1903
- Moved to Munich in 1918
- Some 200 employees
- Areas of focus: biotechnology, basic research on electrolysis, silane chemistry, process and product improvements

To what extent do you cooperate with external research partners?

Even though WACKER has an enormous wealth of knowledge and experience, there are limits, of course. And we have to overcome those. That's why it's so important for us to be open and collaborate with universities, research institutes, startups and other companies and industries. And that's exactly what we do. We maintain collaborative relationships with 45 scientific institutions. Two years ago, we founded the TUM WACKER Institute for Industrial Biotechnology at the Technical University of Munich. Twenty PhD thesis projects are currently underway there. Plus, we also support a number of other PhD candidates from other universities and research institutes right here at the Consortium.

What priorities do you set when it comes to collaborating with external partners?

Cross-sector collaboration – cooperating across various industries, in other words – is becoming increasingly important for us. That might mean joining forces with experts from the steel or cement industries, for example, in order to work on better recycling processes. One great example of this is the "Reallabor" – the "real-world laboratory" – in Burghausen. Companies from various industries have come together there to study sustainable hydrogen use under realistic conditions.

In research you have to work with an eye to the future – looking ahead five to ten years or more. It takes a long time, in other words, before an idea results in a concrete product. What are the keys to success during that long process?

Vision and staying power are important. Fortunately, WACKER is a company with a long-term mindset and doesn't just focus on its next-quarter earnings. That allows us to approach research →

“Research should never be an end in itself – it should always move WACKER forward as a company.”

After studying chemistry, followed by a post doc in biotechnology, Martina Schulze-Adams knows what she’s talking about. Before she assumed the leadership of Corporate R&D, she was the head of Corporate Development and Sustainability at WACKER.

projects with a view to the long run. A lot of our projects are set to last for three to five years. That’s a huge advantage for a researcher like me. But I’m also a manager. That means being both courageous and consistent enough to stop projects when we see that we’re not going to achieve our goals. It may be that customer and market preferences have shifted somewhere along the way, that we’ve reached the limits of a given technology, or that we can’t reach our business and financial goals. Being a researcher and manager at the same time isn’t always easy: it’s a tightrope walk but, ultimately, it’s also exactly what I love so much about this job. •

We challenge the status quo.

Performance and passion
WACKER silicone cartridges recently became available for online purchase by end users in China. This marketing channel was established by a passionate and committed six-strong team.

#1

WACKER tops the Chinese online trading charts for customers looking for silicone cartridges.

Livestreams and chats on online portals are key components of the new marketing concept.

These products are offered on livestream shows and praised by skilled professionals and ambitious DIYers in internet chat rooms: silicone sealants from WACKER have become available in China on all key business-to-customer sales platforms. Consumers wanting to stock up on the green and gold cartridges with the WACKER logo no longer have to turn to specialty retailers or to their local home-improvement store – now they can order the products on the internet and have them sent straight to their door. And business is humming right along. One in every five WACKER cartridges already makes its way into customers' hands through online channels. And that number is growing.

The key driver for this success story is a cross-functional six-person team in China. "We were pretty sure that the marketing model would work," says George Lu, who heads the sealants business for WACKER China. "But even I was surprised by what a hit it turned out to be." The years of work that went into the marketing concept paid off. In 2024, the team received the company's most important research honor – the Alexander Wacker Innovation Award.

Lu, who lives and works in Shanghai, has been involved with silicone sealants ever since he joined the company ten years ago. There was one issue though that bothered him. "WACKER offers high value products, but conventional distributors often aren't interested in actively promoting this. They care more about cost," he says. "So I asked myself: how can we promote the value of our high performance sealants more directly and efficiently to end consumers."

Silicone sealants are the only ready-to-use product in the portfolio of the chemical group. Once dispensed into cartridges, they can be used immediately as adhesives, for sealing joints in kitchens and bathrooms or for installation projects. As a result, no other product lends itself to B2C marketing quite as well. However, WACKER follows different regional marketing models: the company name does not appear in Europe or the Americas, for example. Customers there market the cartridges under their own brand names. Cartridges bearing the WACKER logo are available only in certain countries in the Middle East, Africa and Southeast Asia. And in China.

When Lu assumed leadership of the sealants team in 2020, the company had already had some initial B2C experience. In 2007, WACKER China offered silicone sealants under its own brand name via distributors. However, the initiative was only modestly successful. Lu responded with a new approach that focused on alkoxy silicones, an indisputable premium product. Unlike other sealant technologies, such silicones offer multiple advantages at once: as non-acidic grades, they can be used in various indoor decoration scenarios. They are also highly suitable in bathrooms and wet rooms, where reliable anti-fungi performance is requested. And in terms of consumer protection, alkoxy sealants are especially safe for the user and the environment, as they only emit alcohol during the curing process. →

Delighted with their stroke of marketing genius (from left to right): technical service manager William Wang, distribution manager Maria Mei and business team head George Lu.

"If you want to be successful in China, you have to offer the customer something that the others don't," says Lu.

In 2020, his team started marketing WACKER DA, an alkoxy sealant that is both durable and antifungal, hence the acronym "DA". The antifungial property was also analyzed and certified by an independent testing institute – an utter novelty in China. "WACKER was the first company to put a product like that on the market. So, after a comprehensive marketing campaign, DA became a bestseller, and the WACKER brand was suddenly famous," recalls William Wang, a technical service manager who joined the business team at the time. The consequences of the COVID pandemic also accelerated the business. Many people in China used the pandemic lockdowns as an opportunity to modernize their bathrooms. Low-odor products were in particularly high demand.

Sealants in China: fierce competition

At his office in Beijing, project team member Rula Wang provides marketing support for silicone cartridges in the northern part of the country. He has been in the business as a marketing manager for many years and knows the market like the back of his hand. With over 1,000 manufacturers, China is one of the most challenging sealants markets in the world. Intense competition and a weak construction industry had been generating downward price pressure for a long time, Wang explains. "Construction companies and craftsmen generally opt for cheap products in order to keep costs low, but that leads to defects and complaints. Unfortunately, not enough customers know that you can prevent all that by using high-quality products like our alkoxy silicones."

But that's changing now. The internet and its marketplaces are turning the B2C business on its head – and taking the buying habits of many customers in China with them. China is already one of the world's most important online markets. Over one billion Chinese regularly shop online for clothing, food, cosmetics and consumer electronics – just about anything you need for private consumption. And that includes silicone cartridges.

When examining several e-commerce models, Rula Wang, supported by his colleagues from Distribution Management, Maria Mei and Qiang Cao, quickly realized that WACKER had neither the resources nor the logistics to manage the complexity of online retail by itself. So the managers decided to head in another direction instead, pursuing a variant in which distributors are responsible for the online business. All WACKER has to do is provide the cartridges and the sales and marketing expertise. "The distributors manage all of the online ordering and payment processes, they do the packaging and shipping, and they even process and handle complaints," Cao explains. "Our role is to train the sales personnel and to provide advertising materials for online platforms."

Both managers have spent years studying the development of the sealants business on key online retail platforms. Their findings are hardly surprising: B2C platforms like Tmall, Taobao and Jingdong hold enormous possibility for the WACKER label. "Double-digit growth rates aren't out of the question," Mei says. Online retail does have its own rules, however. "WACKER has a lot of experience in the B2B world and is well established there. But in the B2C business, it's all about the brand. That makes these kinds of marketplaces fundamentally different from the platforms we're used to dealing with," points out Cao, who has been supporting distributors and retailers throughout China for nearly ten years.

E-commerce lite

WACKER began gathering e-commerce experience on Taobao in 2015. The platform, a Chinese eBay of sorts, has 500 million registered visitors, making it one of the most-visited websites in China. In 2018, WACKER followed up with online stores on Jingdong and Tmall, which are the two largest B2C marketplaces in China. Starting in 2022, WACKER products also became available on Suning – more or less a Chinese version of Amazon – as well as on Pinduoduo and TikTok. The latter also features its →

An interdisciplinary team: PR expert Sijie Xiao (right) provides support to vloggers in online social networks with the help of marketing manager Rula Wang (left) and distribution expert Qiang Cao.

own shopping app in China. Users here can purchase products online immediately without having to switch over to an e-commerce marketplace.

The new marketing model was a bit of a hard sell at first. “Our material was good, but people didn’t know our brand well enough,” Cao recalls. Sales figures did not start to go up until distributors began incorporating more advertising and the business team decided to focus on alkoxy sealants for indoor decoration. Livestream shows, which every major e-commerce platform in China offers nowadays, proved to be particularly effective. These ongoing advertising programs exclusively pitch brand-name products, such as WACKER silicone cartridges. During the broadcast, viewers can ask questions using the live-chat feature and immediately receive answers in real time.

The investments are paying off. In internet searches, cartridges bearing the WACKER logo with an overlay of the German flag are routinely among the top hits. “For a lot of Chinese, the ‘Made in Germany’ label still serves as a seal of quality. Our products benefit from that too,” says Rula Wang. Distribution expert Qiang Cao agrees. Among online retailers, WACKER cartridges have actually gained cult status, he notes. “A lot of people even compare the WACKER brand to Apple.”

Do it yourself

Starting in 2023, the marketing team also began exploring social media opportunities. Do-it-yourself videos on platforms like Xiaohongshu were particularly interesting. In these, homeowners – even those with little in the way of handyman skills – can learn how to seal a joint perfectly and discover which silicone they need to guarantee a successful job. These kinds of product recommendations are a gold mine, which is why collaboration with do-it-yourself experts has recently begun playing a bigger and bigger role for the project team. Starting in 2023, the marketing team also began exploring social media opportunities.

That’s especially true for Sijie Xiao. The PR expert, whose role includes corporate and marketing communications and support for the WACKER Academy in Shanghai, is the first point of contact for social media inquiries. Her work currently revolves around three platforms: WeChat – for posting company and product news – TikTok and Xiahongshu, which are also used for influencer marketing. “You can’t measure the success of our work in sales numbers,” Xiao points out. “It’s more about establishing WACKER as a powerful brand and earning positive reviews that grow our brand value significantly.”

The success of the new business model in China could also be a blueprint for other regions. Qiang Cao, who is already investigating several new online options, agrees. “With our example, we would like to encourage other teams in the global WACKER network to take a close look at the possibilities the internet offers for the direct marketing of their products locally.” •

We go beyond.

Integrity and example
So many WACKER employees go above and beyond in their work. They are united by the drive to do their bit for a better world. Here are eight examples.

Carolyn Ng

Cancer is one of the most common causes of death worldwide. Together with colleagues, Carolyn therefore supports the Singapore Cancer Society. For example, the team packs bags of basic foodstuffs for the holidays and delivers them to the homes of cancer patients from low-income families. “This also allows us to talk directly to the patients, get to know their living conditions and find out if they need further help,” says Carolyn. “We then inform the Cancer Society in order to further improve support services.” For Carolyn, a passionate commitment to the community is a natural part of her job as communications manager. Against this backdrop, she also heads WACKER’s Social Responsibility Committee in Singapore.

Role: Communications Manager, Singapore
Initiative: Cancer aid

Lisa Mantooth

Lisa is involved in many ways in her local community in Cleveland. About 20 years ago, she joined a project coordinated by Habitat for Humanity for the first time. She actively helped to build a home for a couple who were both confined to a wheelchair. This project not only brought to her attention the need for affordable housing, but also housing that was equipped for people with disabilities. “I had the feeling that I could make a difference for the people in my community together with others,” says Lisa. “Regardless of whether it is a Habitat for Humanity initiative or other projects such as working with students in schools. It brings me joy to see how we as a WACKER team are committed to issues that are close to our hearts, even outside of work. This also strengthens WACKER’s connection to the local community.”

Role: Community Relations and Communications Manager, Charleston, USA
Initiative: Local commitment

Ying Wu

“A child, a teacher, a pen and a book can change the world,” is a quote from Malala Yousafzai, the youngest winner in the history of the Nobel Peace Prize. Ying, too, is also convinced of this. She is involved in WACKER Help, the Chinese subsidiary’s charity organization. She has launched an educational program in which employees at WACKER’s Zhangjiagang site teach students at a local elementary school. Since the beginning of 2023, Ying and her colleagues have held a number of lessons at the school. “We want to get students excited about scientific topics and ignite their passion for them,” explains Ying. “One of the ways we achieve this is through interactive laboratory experiments and the practical presentation of complex topics such as the greenhouse effect.”

Role: Supply Chain Manager, Zhangjiagang, China
Initiative: Science education

Mirko Kappelhoff

In addition to his work at WACKER, Mirko is chair of the WACKER Relief Fund that supports victims of natural disasters in Germany and other parts of the world. “We focus primarily on educational projects and helping people to help themselves,” Mirko explains. For example, the WACKER Relief Fund has contributed to the reconstruction of schools following earthquakes in China, Haiti, Nepal and Pakistan, and has been active during wars and after floods. For Mirko, it is important to also go to the sites in person to get an overall idea of the situation. He recently inaugurated a solar-powered water kiosk in Togo – with a lasting impact on health and climate protection. He also visited a cooperation project in Kosgoda, Sri Lanka, where the WACKER Relief Fund has been supporting a school for two decades. “These on-site visits are extremely valuable because they also ensure that our donations are well received,” Mirko says.

Role: Lawyer, Munich, Germany
Initiative: WACKER Relief Fund (WACKER Hilfsfonds)

Jeffrey Maylas

Jeffrey is experiencing the effects of climate change first hand in the Philippines: typhoons are occurring more frequently and flooding is increasing. Another problem is the increasing amount of plastic waste that clogs waterways and is washed ashore after a typhoon. In 2019, Jeffrey and his teammates therefore decided to join the international Coastal Cleanup initiative. Together, they remove waste along the coast and meticulously record the type and quantity for further analysis. “We want to lend a hand in our local community and help reduce pollution,” says Jeffrey, explaining his motivation. “At the same time, we hope that the data we collect will also contribute to research into marine pollution and waste management worldwide.”

Role: Market Development Manager, Manila, Philippines
Initiative: Coastal cleanup

Carolin Werner

Since the devastating wildfires in eastern Germany in the summer of 2022, Carolin has been volunteering for the Technical Relief Service (THW), Germany’s civil protection and disaster response organization. “I couldn’t just stand by and watch, I wanted to help too,” says Carolin. After six months of basic training, she is now working in emergency repairs and emergency supply. In this role, she helps wherever needed in the event of a disaster: setting up tents for the emergency services, ensuring the fuel supply and operating pumps. At the same time, she supports the youth work of the organization’s local chapter. “It’s worth leaving your comfort zone, taking responsibility and being there for others,” Carolin remarks. “Above all, I personally appreciate the feeling of togetherness and the close contact with other volunteers.”

Role: Chemical technician at the polymer plant, Nünchritz, Germany
Initiative: Disaster aid

Joon-Beom Ahn

A key experience spurred Joon-Beom into action: a mass panic during the Halloween celebrations in Seoul in 2022. Many people lost their lives in the crush and many were injured. Together with friends, Joon-Beom then joined the volunteer fire department in his community. Late in the evening, he checks critical locations where fires could break out or heavy rainfall could cause flooding. Joon-Beom is also involved in accident prevention, trains children in first aid and is active as a lifeguard. “There are so many ways in which each individual can contribute to greater safety,” he says. “I don’t see my various volunteering efforts as a burden at all, but rather as a personal enrichment by making a contribution to the community.”

Position: Sales and Marketing Manager, Seoul, South Korea
Initiative: Volunteer fire department

Magno Andrade

Magno has always had a soft spot for the English language. Even as a schoolboy he helped his classmates in Brazil with their English. He later found out about volunteering as an English teacher through a chance contact on LinkedIn. After the selection process, he started work two years ago. Magno mainly teaches young people from low-income backgrounds who come from state schools and cannot afford the cost of an English course. “It’s fascinating to see how the students develop over time and the progress they make,” says Magno. “It is also particularly motivating for me to feel the positive impact of this project on the pupils’ lives and ultimately their gratitude. This also spurs me on to continuously develop my skills as a teacher.”

Position: Maintenance Manager, São Paulo, Brazil
Initiative: Working with students in schools
